*Skeletons*

More than 98 percent of all animal species have no bony vertebrae or skeletons and are collectively classified as invertebrates. Jellyfish, octopuses, worms, snails, crabs and lobsters, insects, squid and sea stars are some common examples. The invertebrate designation has no bearing on the biological traits or characteristics of the species.

*Which Animals Have No Skeletons? - Reference.com*

Soft-bodied organisms are animals that lack skeletons. The group roughly corresponds to the group Vermes as proposed by Carl von Linné.

All animals have muscles but, since muscles can only pull, never push, a number of animals have developed hard parts that the muscles can pull on, commonly called skeletons. Such skeletons may be internal, as in vertebrates, or external, as in arthropods. However, many animals groups do very well without hard parts. This include animals such as earthworms ...

Pupils might work scientifically by: identifying and grouping animals with and without skeletons and observing and comparing their movement; exploring ideas about what would happen if humans did not have skeletons. They might compare and contrast the diets of different animals (including their pets) and decide ways of grouping them according to ...

*Outstanding Science | Year 3 - Animals, including humans*

Some animals, like insects and crabs, have a completely different type of skeleton from ours - their skeletons are external (on the outside of their bodies). They are called invertebrates because they do not have a backbone made up of vertebrae. Some other invertebrates, like jellyfish, have no skeleton at all! Can you think of other animals?

*The Learning Zone: The Living Animal*

That's because those artists tend to base their drawings on the fossils alone, while ignoring what the animal might have looked like with layers of fat and other things. Paleoartists John Conway and C.M. Kosemen drew animals like the way Hollywood draws dinosaurs to show us why dinosaur art can sometimes be so flawed.

An exoskeleton (from Greek *éxō*, "outer" and *skelētós* "skeleton") is the external skeleton that supports and protects an animal's body, in contrast to the internal skeleton (endoskeleton) of, for example, a human. In usage, some of the larger kinds of exoskeletons are known as "shells". Examples of animals with exoskeletons include insects such as grasshoppers and ...
