The sea is only a couple of minutes away. Near to the beautiful beaches are facilities such as restaurants, beach bars, taxi boats, a rent-a-boat service, a diving centre, etc. Tennis courts are also ...

The Canadian Forces have used decompression computers for a number of years. However, advances in electronics have allowed the older analogue computers to be replaced by more sophisticated digital electronic computers (XDC-2's) which monitor the diver's depth and calculate the safe depth in real time. An operation lasting four weeks was conducted at DCIEM utilizing the newly acquired Deep Diving Facility as the vehicle to test the operational diving envelope of the XDC-2 Decompression Computer at 36-54 msw. Ultrasonic Doppler monitoring techniques were used throughout the series of dives to measure bubble activity in the pulmonary artery. The initial results would seem to elucidate the XDC-2 computer envelope by adding more information and more clearly defining the present calculated operational curves. As it was necessary to find a new reference point between the calculated curves, The Royal Navy Limiting Line as published in the R.N. Diving Manual (BR 2806) Table Eleven, was introduced as a datum line. It was found that there was a degree of correlation between the R.N. Limiting Line and that of the XDC-2 recalculated operational envelopes. Doppler ultrasonic monitoring results confirmed the severity of a dive and it was possible to grade a dive profile as mild, moderate or severe. (Author).

Admiralty Manual of Seamanship

This book is designed to be a physician's guide for those interested in diving and hyperbaric environments. It is not a detailed document for the erudite researcher; rather, it is a source of information for the scuba-diving physician who is searching for answers put to him by his fellow nonmedical divers. Following the publication of The Underwater Handbook: A Guide to Physiology and Performance for the Engineer there were frequent requests for a companion volume for the physician. This book is designed to fill the void. Production of the book has been supported by the Office of Naval Research and by the Bureau of Medicine and Surgery, Research and Development Command, under Navy Contract No. NOOOO14-78-C-0604. Our heartfelt thanks go to the many authors without whose contributions the book could not have been produced. These articles are signed by the responsible authors, and the names a--e also listed alphabetically in these preliminary pages. Every chapter was officially reviewed by at least one expert in the field covered and these reviewers are also listed on these pages. Our thanks go to them for their valuable assistance. We are grateful to Marthe Beckett Kent for editing Chapter III. Our thanks also go to Mrs. Carolyn Paddon for typing and retyping the manuscripts, and to Mrs. Catherine Coppola, who so expertly handled the many fiscal affairs.

To maintain quality in research output, providing the necessary new knowledge for our developing industries must be of prime importance to our community. This is an extremely difficult task when viewed in the context ofthe rapid rate of change being experienced within our national industrial scene. Collaborative research programmes designed to constantly monitor and improve the quality of output, through regular reporting and assessment of achieved goals against defined targets, can help the growth of our industry and benefit the rest of society. The government has established initiatives to encourage collaboration and the transfer of technology between the research and development domains. There are many signs that industry and the universities are making a concerted effort to adapt their working practices and relationships to meet the rapidly changing industrial environment. There are still many shortfalls and areas for improvement. Some of the extremes of government educational policy can, and will, seriously impair the evolution of, and benefits gained from, the collabo ration initiatives. These must be resisted by academe and industry alike if we are to make new advances against foreign competition. Joint R. and D. projects do work, and can be made to work. To achieve the steady growth of healthy and fruitful relationships they must, however, be given a good environment and a nourishing diet. REFERENCES 1. Alvey Programme Annual Report(s), Alvey Directorate, Millbank Tower, Millbank, London, SW1P 4QU. 2. Annual Review of Government Funded R. & D. (1985). The relationship between resources and development is the pivot around which the present study revolves. Focussing on the process of resource creation and utilization it emphasizes the need of equitable development integrating local needs, resources, people and functions. The resource exploitation and their utilization are two independent economic activities influenced by different algorithms and usually have manifested in core-periphery relationship. Reviews the persistent problems of economic development in perspective of exploitation of natural resources with the objective to provide some clues for occurrence and persistence of regional disparities and for suggesting a development model synchronising both the resource management and environmental protection.
