This is the law of conservation of linear momentum: when the net external force on a system of objects is zero, the total momentum of the system remains constant.

Equivalently, the total momentum of an isolated system remains constant. Copyright © 2009 Pearson Education, Inc. 9-2 Conservation of Momentum Example 9-3: Railroad cars collide: momentum

Washing a car: momentum change and force. Water leaves a hose at a rate of 1.5 kg/s with a speed of 20 m/s and is aimed at the side of a car, which stops it. (That is, we ignore any splashing back.) What is the force exerted by the water on the car? Figure 9-2.

9.4 Linear momentum DEFINITION: • m is the mass of the particle and v is its velocity. • The time rate of change of the momentum of a particle is equal to the net force acting on the particle and in the direction of the net force. • Manipulating this equation: Newton ' s 2nd Law

calculated as its velocity times its mass, and given the symbol p . As mass is a scalar and velocity is a vector, momentum is also a vector quantity. The concept of momentum comes from the force from Newton ' s Second Law. Momentum has units of kg m/s .

Chapter 9: Linear Momentum – Introductory Physics Resources

In this chapter, we develop and define another conserved quantity, called linear momentum, and another relationship (the impulse-momentum theorem), which will put an additional constraint on how a system evolves in time. Conservation of momentum is useful for understanding collisions, such as that shown in the above image.

Ch. 9 Introduction - University Physics Volume 1 | OpenStax
9.2: Linear Momentum Momentum is a concept that describes how the motion of an object depends not only on its mass, but also its velocity. Momentum is a vector quantity that depends equally on an object's mass and velocity. The SI unit for momentum is $\text{kg} \cdot \text{m/s}$.
