One of the primary requirements of a current-mode logic circuit is that the current bias transistor must remain in the saturation region in order to maintain a constant current.

This paper presents a gm/ID based design methodology for low voltage current mode circuits using standard CMOS technology. A second generation current conveyor (CCII) and a current feedback operational amplifier (CFA) are designed using the discussed design procedure. Both circuits operate from a single 0.4 V supply.

For example, the basic Gate chip uses the current of 0.1mA only (in standby mode). Even the wristwatch chip uses a CMOS type IC. We only use a small battery. But can be used for up to 1 year. It consumes electricity almost zero. Use 74Cxx series it looks like TTL. For example 74C04, a CMOS that is equivalent to the TTL, 7404. This modern CMOS has a high speed. It has a capability equal to TTL.

Abstract. The rapid down-scale of the feature size of MOS devices, the aggressive reduction in the supply voltage, and the moderate reduction in the threshold voltage of modern CMOS technologies have greatly affected the performance of CMOS current-mode circuits, reflected by a small dynamic range, a reduced effective gate-source voltage, a low device output impedance, and an increased level ...

The circuits generate a constant reference voltage and current for various other components such as operational amplifiers, comparators, AD/DA converters, oscillators, and PLLs. For this purpose, bandgap reference circuits with CMOS-based vertical bipolar transistors are conventionally used in CMOS LSI's [5; 6].

In this project, a CMOS-based circuit model of an analog function generator that can realize a large number of non-linear functions is presented. The circuit model is based on a 5 th-order polynomial approximation of any non-linear function and is compatible with the CMOS technology currently used in digital signal processing. Another advantage of this model is the operation of the CMOS transistors in the strong inversion region, leading to the possible circuit operation at high frequencies.
