data, called an object. The name is a string of characters and it is mapped to an object. The name of a variable, by itself, is treated as an expression that evaluates to whatever object it is mapped to. This mapping of strings to objects is often depicted using boxes to represent the objects and arrows to show the mapping. Every object has a type.

Object-oriented programming (OOP) is a programming paradigm based on the concept of objects, which are data structures that contain data, in the form of fields (or attributes) and code, in the form of procedures, (or methods). A distinguishing feature of objects is that an object's procedures provide access to and modify its fields.
