Gravitational-Wave Physics and Astronomy: An Introduction ...

Gravitational-wave astronomy is an emerging branch of observational astronomy which aims to use gravitational waves to collect observational data about objects such as neutron stars and black holes, events such as supernovae, and processes including those of the early universe shortly after the Big Bang. Gravitational waves have a solid theoretical basis, founded upon the theory of relativity. They were first predicted by Einstein in 1916; although a specific consequence of general relativity, t

The Gravitational Wave Physics MSc provides broad and comprehensive training in both theory and experiment in gravitational wave (GW) physics and astronomy. The field of gravitational physics has grown rapidly in the last few years following the first direct detection of gravitational waves in 2015, one hundred years since they were first predicted by Einstein's general theory of relativity.

A gravitational wave is an invisible (yet incredibly fast) ripple in space. We've known about gravitational waves for a long time. More than 100 years ago, a great scientist named Albert Einstein came up with many ideas about gravity and space. Albert Einstein, official 1921 Nobel Prize in Physics photograph.

Our research focuses on detecting cosmic gravitational waves and developing gravitational-wave observations as an astronomical tool. We are part of the Laser Interferometer Gravitational Wave Observatory (LIGO) scientific collaboration which announced the first direct detection of gravitational waves in 2015, a century after they were first predicted by Einstein.

The first observation of gravitational wave signals in 2015, resulting from the merger of two stellar black holes, marked the beginning of the era of gravitational wave astronomy. Now, astrophysicists want to write a new chapter and detect gravitational waves in the nanohertz range, which e.g. supermassive black holes orbiting one another create, long before they collide.

Gravitational wave astronomy: Black holes have no hair ...

A New Era in Fundamental Physics & Astronomy LIGO and Virgo were built to observe the gravitational waves emitted from the merger of compact binaries, such as two black holes or two neutron stars. And these types of mergers are the only events that the detectors have confidently spotted in the first two observing runs.

Physics - Gravitational-Wave Astronomy Still in Its Infancy

GOTO is an autonomous, intelligent telescope, which will search for unusual activity in the sky, following alerts from gravitational wave detectors - such as the Advanced Laser Interferometer Gravitational-Wave Observatory (Adv-LIGO), which recently secured the first direct detections of gravitational waves. Gravitational waves are ripples in the fabric of space-time, created when massive bodies - particularly black holes and neutron stars - orbit each other and merge at very high speeds.
