The quantitative modeling of complex systems of interacting risks is a fairly recent development in the financial and insurance

industries. Over the past decades, there has been tremendous innovation and development in the actuarial field. In addition to undertaking mortality and longevity risks in traditional life and annuity products, insurers face

Download Free Introduction

unprecedented financial risks since the introduction of equity-linking insurance in 1960s. As the industry moves into the new territory of managing many intertwined financial and insurance risks, non-traditional problems and

Download Free Introduction

challenges arise, presenting great opportunities for technology development.

Today's computational power and technology make it possible for the life insurance industry to develop highly sophisticated models, which

Download Free Introduction

were impossible just a decade ago. Nonetheless, as more industrial practices and regulations move towards dependence on stochastic models, the demand for computational power continues to grow. While the industry continues

to rely heavily on hardware innovations, trying to make brute force methods faster and more palatable, we are approaching a crossroads about how to proceed. An Introduction to Computational Risk Management of Equity-Linked
