Mendelian Genetics Coin Toss Lab PRE-LAB DISCUSSION: In heredity, we are concerned with the occurrence, every time an egg is fertilized, of the probability that a particular gene or chromosome will be passed on through the egg, or through the sperm, to the offspring. As you know, genes and chromosomes are present in pairs in each individual, and segregate as they go into the gametes (egg and ...

Toss both coins together to simulate gamete formation (meiosis) and fertilization. ? The offspring's genotype is the combination of the 2 sides that land facing up (e.g. if you get 2 tails facing up, the genotype would be "dd.") 6. Tally the genotype results in Data Table 1 in the "Observed Tally" column.

Toss a penny 32 times and record the data (heads or tails) in notebook under Penny A. 6. Toss the penny 32 times again and record the data under Penny B 7. Write an R by each head, and a r by each tail. 8. Assume that penny A and penny B are male and female gametes, and the combination of their tosses (R or r) is the possible zygote and record the genotype and phenotype of each zygote. 9 ...

[probability and mendelian genetics - lab report | Genetics -](#)

For our coin-toss experiment, heads will represent P the allele and tails will represent the p allele. Toss the coins together a total of 50 times, recording the toss results in the Coin Toss Tally column. 5. Determine the percentage for each genotype (Ex. # of PP tosses/50) and record under Actual Probability on Table 1.
