This paper intends to update methods of molecular cytogenetics available as diagnostic adjuncts in the field of MM. Cytogenetics has highlighted the pathogenesis of atypical melanocytic neoplasms with emphasis on the activation of the mitogen-activated protein kinase (MAPK) signalling pathway during the initiation step of the neoplasms. 20 to 40% of MM families have mutations in the tumour suppressor gene p16 or CDKN2A.

Molecular Dermopathology in Malignant Melanoma

Recent studies in our laboratory have identified novel molecular diagnostic and prognostic markers based on analyses in large cohorts of melanoma patients. These markers were initially derived from gene expression profiling analyses of distinct stages of melanoma progression. Immunohistochemical analyses confirmed the differential expression of these markers, and immunohistochemistry-based multimer assays were developed to assess melanoma diagnosis and prognosis at the molecular level.

Sanger sequencing, which was used in the initial identification of most melanoma-prevalent mutations, is an open method that detects virtually any genomic mutational event occurring between the sequencing primer pairs, including substitutions, deletions, and insertions.

New Strategies in Melanoma: Molecular Testing in Advanced ...

Molecular diagnostic tests can be used to select a cancer therapy and/or to monitor the effects of a treatment based on characteristics of or changes in the biomarker. This approach has revolutionized cancer diagnosis and treatment. However, many patients who are matched to a therapy based on the genomic profile of their tumors either do not respond to the therapy initially or do not experience a sustained response.

Molecular diagnostics is a collection of techniques used to analyse biological markers in the genome and proteome—the individual's genetic code and how their cells express their genes as proteins—by applying molecular biology to medical testing. The technique is used to diagnose and monitor disease, detect risk, and decide which therapies will work best for individual patients. By analysing the specifics of the patient and their disease, molecular diagnostics offers the prospect of ...

A sensitive detection method usually used to identify aggregated prion proteins has been adapted for the diagnosis of Parkinson's disease in skin samples. An unmet clinical need in Parkinson's disease (PD) has been the identification of biomarkers for diagnosis, preferably in easily accessible tissues such as skin.
