Particle-induced X-ray emission or proton-induced X-ray emission (PIXE) is a technique used in the determining of the elemental make-up of a material or sample. When a material is exposed to an ion beam, atomic interactions occur that give off EM radiation of wavelengths in the x-ray part of the electromagnetic spectrum specific to an element. PIXE is a powerful yet non-destructive elemental ...

Particle Induced X-ray Emission Basic physical principles As a charged particle moves through a material, it loses energy primarily by exciting electrons in the atoms that it passes by.

Particle Induced X-ray Emission | ANSTO

Particle induced x ray emission (PIXE) is an elemental analysis technique that employs a mega electron volt energy beam of charged particles from a small electrostatic accelerator to induce characteristic x ray emission from the inner shells of atoms in the specimen. The accelerator can be single ended or tandem.

Particle-induced X-ray emission (PIXE) is a technique that induces characteristic XRF by bombarding the surface of the sample with photons or helium ions. As a result of its low detection limits (between 1 and 100 ppm) for samples weights of a few milligrams, and the higher sensitivity obtained compared to XRF, PIXE is used to detect trace elements as well as major and minor elements.
