~~Photochemistry of Organic Compounds From Concepts to ...~~

Organic photochemistry encompasses organic reactions that are induced by the action of light. The absorption of ultraviolet light by organic molecules often leads to reactions. In the earliest days, sunlight was employed, while in more modern times ultraviolet lamps are employed. Organic photochemistry has proven to be a very useful synthetic tool. Complex organic products can be obtained simply.

~~Organic photochemistry - Wikipedia~~ ~~March 2009~~

Indeed, one of the classic photochemical reactions of organic chemistry is the formation of 1,1,2,2-tetraphenyl-1,2-ethanediol (3, benzopinacol) by the action of light on a solution of diphenylmethanone (2, benzophenone) in isopropyl alcohol. The yield is quantitative.

~~Photochemistry — Organic Syntheses with Light~~

• The first law of photochemistry, the Grotthuss-Draper law, states that light must be absorbed by a compound in order for a photochemical reaction to take place. • The second law of photochemistry, the Stark-Einstein law, states that for each photon of light absorbed by a chemical system, only one molecule is activated for subsequent reaction. This "photoequivalence law" was derived by ...

Photochemistry is the branch of chemistry

concerned with the chemical effects of light.

Generally, this term is used to describe a

chemical reaction caused by absorption of

ultraviolet, visible light or infrared

radiation. In nature, photochemistry is of

immense importance as it is the basis of

photosynthesis, vision, and the formation of

vitamin D with sunlight. Photochemical

reactions proceed differently than

temperature-driven reactions. Photochemical

paths access high energy intermediates th
