An essentially self-contained homotopy theory of filtered (A_∞) algebras and (A_∞) bimodules and applications of their obstruction-deformation theory to the Lagrangian Floer theory are presented. Volume II contains detailed studies of two of the main points of the foundation of the theory: transversality and orientation.

AMS :: Curtis: Pioneers of Representations Theory

Historically, the representation theory of finite groups was developed with the same motivation: Turning problems in group theory into problems in linear algebra. The study began with Cauchy and Dedekind's work in the early 1800s on what later became character theory [Cau41, Ded85, Tau33]. However, Frobenius was the first mathematician to

KEITH CONRAD Abstract. Representation theory was created by Frobenius about 100 years ago. We describe the background that led to the problem which motivated Frobenius to define characters of a finite group and show how representation theory solves the problem. The first results about representation theory in characteristic p are also discussed.
