View MATLAB Command. Modulate data using QAM and display the result in a scatter plot. Set the modulation order to 16 and create a data vector containing each of the possible symbols. $M = 16$; $x = (0:M-1)'$; Modulate the data using the `qammod` function. $y = \text{qammod}(x, M)$;

 $ca = \sin(c) .* (\text{symsI}/50)$; $cb = \cos(c) .* (\text{symsQ}/50)$; We implement our phase shifting by passing the carrier vector `c` through either `sin` or `cos`. Additionally, we apply some attenuation to our analogue signals to prevent them from making our carrier too large - we'll do the inverse during the demodulation.

`z = qamdemod (y,M,symOrder)` returns a demodulated signal, `z`, and specifies the symbol order for the demodulation. `z = qamdemod (____,Name,Value)` specifies options using one or more name-value pair arguments. For example, `'OutputType','bit'` sets the type of output signal to bits.

The procedure is called quadrature amplitude modulation, QAM abbreviated because the sum pointer can be separated into two perpendicular components. The method described herein is the analog QAM, for example, comes in the analog color television engineering. There, the two color difference signals (B-Y) and (R-Y) amplitude modulate the same ...

An OFDM carrier signal is the sum of a number of orthogonal subcarriers, with baseband data on each subcarrier being independently modulated commonly using some type of quadrature amplitude modulation (QAM) or phase-shift keying (PSK). This composite baseband signal is typically used to modulate a main RF carrier.

Quadrature Amplitude Modulation - an overview ...

Quadrature amplitude modulation (QAM) is the name of a family of digital modulation methods and a related family of analog modulation methods widely used in modern telecommunications to transmit information. It conveys two analog message signals, or two digital bit streams, by changing (modulating) the amplitudes of two carrier waves, using the amplitude-shift keying (ASK) digital modulation ...
