Looks at the origin of complex cells, highlighting the importance of single-cell forms, symbiosis, and evolution, along with information on the author's explorations in such places as Egypt, the Caribbean, and Canada.

In the follow up to Darwin's Lost World, Martin Brasier book introduces the quest for the missing history of life and the cell. Through a series of journeys it emerges that the modern plant cell is one of the most deeply puzzling and unlikely steps in the whole history of life. Decoding this puzzle is a great adventure that has mainly taken place over the last half century. Brasier puts the big questions into context through lively descriptions of his explorations around the world, from the Caribbean Sea and the Egyptian pyramids, to the shores of the great lakes in Canada, and to the reefs and deserts of Australia. Covering the period from 1 to 2 billion years ago - a period he once dubbed 'the boring billion' - he demonstrates how it in fact involved great evolutionary potential with the formation of the complex (eukaryotic) cell. Without this cell there would be nothing on Earth today except bacteria, and the formation of this cell was a

fundamental turning point in the history of life on Earth. Weaving together several threads, Brasier emphasises the importance of single-celled forms to marine ecosystems; symbiosis and coral reefs; and the architecture and beauty of single-celled Foraminifera and what they tell us about evolution. From a master storyteller comes a vivid description of the earliest biological forms and a set of fascinating tales of travels and research.

A firsthand, behind-the-scene account of the controversies surrounding modern explorations at Giza • Investigates the recent scandals at Giza and claims of secret excavations and tunneling inside the Great Pyramid • Reveals the historical evidence in support of secret chambers in the Great Pyramid and beneath the Great Sphinx • Exposes the secret agendas behind the latest explorations on the Giza plateau Since 1993 Robert Bauval has been embroiled in the many controversies involving the search for the lost treasures of the pyramid builders and the quest for the legendary Hall of Records of Atlantis. The strange but true story that he unfolds implicates American business moguls, the prestigious National Geographic Society, several Ivy League universities, the Edgar Cayce Foundation, the Freemasons, Christian fundamentalists, Zionists, and the Egyptian government. In this fully updated edition of Secret Chamber, including new color photographs, Robert Bauval pursues his in-depth investigation of clandestine events at Giza and the role played by the controversial ex-Minister of Antiquities Dr. Zahi Hawass. What lies behind the mysterious doors at the end of the star shafts in the Great Pyramid? What do the mysterious inscriptions found behind the Gantenbrink door mean? What is the real purpose of the Relief Chambers and the red ochre “ graffiti ” in them? Who is behind the secretly tunneling and excavating in these chambers, and why? Is there really a hidden Hall of Records from Atlantis beneath the Great Sphinx? Is the Great Pyramid just a tomb or does it serve a higher purpose involving a lost science of immortality? Why do the ancient texts ascribe the Pyramid ’ s design to the supreme god of wisdom Thoth, the writer of the fabled Books of Hermes? Will the Great Pyramid prove to be the “ missing link ” to our true origins or a “ metaphysical machine ” to access the world beyond? Providing a firsthand account of the strange events that have taken place at the Giza plateau in the last three decades, Bauval reveals the hidden agendas behind these events and raises important questions about the meaning of Egypt ’ s ancient

structures and the very origins of civilization.

What is life? Where do we come from and how did we evolve? What is the universe and how was it formed? What is the nature of the material world? How does it work? How and why do we think? What does it mean to be human? How do we know? There are many different versions of our creation story. This book tells the version according to modern science. It is a unique account, starting at the Big Bang and travelling right up to the emergence of humans as conscious intelligent beings, 13.8 billion years later. Chapter by chapter, it sets out the current state of scientific knowledge: the origins of space and time; energy, mass, and light; galaxies, stars, and our sun; the habitable earth, and complex life itself. Drawing together the physical and biological sciences, Baggott recounts what we currently know of our history, highlighting the questions science has yet to answer.

Over a very short period, only a few hundred years, our understanding of the cosmos, our planet Earth, the evolution of life on it, and the beginnings of our very own human endeavor have radically changed. These revolutions in science and technology have dramatically altered our societies in many ways. For quite some time it seemed as if our planets resources were unlimited. Today we know that this is not the case. Human civilizations are shaping our planets future in ways that have profound consequences for all other life on Earth as well as for us. We need to reflect broadly on what defines our human condition if we wish our societies to be successful in navigating a future that cannot be just ours but must include the broad diversity of life on Earth without which humankind will not survive. This book tells the story of how we discovered the universe, how we learned about our planet and the life evolving on it, how humanity emerged from pre-history, and what some of the future of our civilizations could hold.

it? Of course not--but you should, and New York Times bestselling author Steven Johnson has. This adaptation of his adult book and popular PBS series explores the fascinating and interconnected stories of innovations--like clean drinking water and electricity--that changed the way people live. Innovation starts with a problem whose solution sets in motion all kinds of unexpected discoveries. That's why you can draw a line from pendulums to punching the clock at a factory, from ice blocks to summer movie blockbusters, from clean water to computer chips. In the lively storytelling style that has made him a popular, bestselling author, Steven Johnson looks at how accidental genius, brilliant mistakes, and unintended consequences shape the way we live in the modern world. Johnson's "long zoom" approach connects history, geography, politics, and scientific advances with the deep curiosity of inventors or quirky interests of tinkerers to show how innovation truly comes about. His fascinating account is organized into six topics: glass, cold, sound, clean, time, light. Johnson's fresh exploration of these simple, single-syllable word concepts creates an endlessly absorbing story that moves from lightning strikes in the prehistoric desert to the herculean effort to literally raise up the city of Chicago to laser labs straight out of a sci-fi movie. In other words, it's the story of how we got to now!

At a time when the planet ' s wildlife faces countless dangers, international environmental law continues to overlook its evolving welfare interests. This thought-provoking book provides a crucial exploration of how international environmental law must adapt to take account of the growing recognition of the intrinsic value of wildlife.

Foraminiferal Micropaleontology for Understanding Earth ' s History incorporates new findings on taxonomy, classification and biostratigraphy of foraminifera. Foraminifera offer the best geochemical proxies for paleoclimate and paleoenvironment interpretation. The study of foraminifera was promoted by oil exploration due to its exceptional use in subsurface stratigraphy. A

rapid technological development in the past 20 years in the field of imaging microfossils and in geochemical microanalysis have added novel information about foraminifera. Foraminiferal Micropaleontology for Understanding Earth ' s History builds an understanding of biology, morphology and classification of foraminifera for its varied applications. In the past two decades, a phenomenal growth has occurred in geochemical proxies in shells of foraminifera, and as a result, crucial information about past climate of the earth is achieved. Foraminifera is the most extensively used marine microfossils in deep-time reconstruction of the earth history. Its key applications are in paleoenvironment and paleoclimate interpretation, paleoceanography, and biostratigraphy to continuously improve the Geologic Time Scale. Provides an overview of the Earth history as witnessed and evidenced by foraminifera Discusses a variety of geochemical proxies used in reconstruction of environment, climate and paleobiology of foraminifera Presents a new insight into the morphology and classification of foraminifera by modern tools of x-ray microscopy, quantitative methods, and molecular research
