Gas planet facts. The gas planets are Jupiter, Saturn, Uranus and Neptune. They are the furthest planets from the Sun. They each have many moons. They are much bigger than the rocky planets.

[What are the gas planets? - BBC Bitesize](#)

Gas molecules move in three dimensions, whereas the drunkard moves in two dimensions; however, the result is the same. Thus, the square root of  $N$  multiplied by the length of the mean free path equals the length of the diffusion tube:  $N^{1/2} l = 10^2$  cm. From the equations for  $Nl$  and  $N^{1/2} l$ , it can readily be calculated that  $N = 2.5 \times 10^{13}$  collisions and  $l = 2.0 \times 10^{-5}$  cm. The mean time ...

[Gas | state of matter | Britannica](#)

Gas is one of the four fundamental states of matter (the others being solid, liquid, and plasma). A pure gas may be made up of individual atoms (e.g. a noble gas like neon), elemental molecules made from one type of atom (e.g. oxygen), or compound molecules made from a variety of atoms (e.g. carbon dioxide). A gas mixture, such as air, contains a variety of pure gases.

Gas laws, laws that relate the pressure, volume, and temperature of a gas. Boyle's law—named for Robert Boyle—states that, at constant temperature, the pressure  $P$  of a gas varies inversely with its volume  $V$ , or  $PV = k$ , where  $k$  is a constant. Charles's law—named for J.-A.-C. Charles (1746–1823)—states that, at constant pressure, the volume  $V$  of a gas is directly proportional to ...
