Therapeutic Shoeing Part 1: Foot Fundamentals
- The Horse

The horse's hoof is a miracle of engineering. It contains a whole host of structures which, when healthy, operate in equilibrium with each other to form a hoof capsule which is able to withstand huge forces, utilising energy to assist with forward movement while providing protection to the sensitive structures beneath.

Historically, horses were shod to reduce the surface wear on their hooves and to protect the feet from contact with hard ground when being used for pulling or riding. The shoeing of horses allowed them to be used for longer periods of time and over more varied footing than would otherwise be possible.
