insights based on the authors' decades of experience, the Saint-Chopra Guide ushers clinicians through common clinical scenarios from admission to differential diagnosis and clinical plan. In the shock syndrome, various initial stresses lead to a common, hemodynamic pathway of severely reduced tissue perfusion with hypoxemia and acidosis. The goal in shock treatment is to restore a state of circulatory balance in which the volume of blood perfusing tissue, especially certain vital viscera, carries with it enough oxygen to meet the tissue metabolic requirement for oxygen (MRO<sub>2</sub>). Metabolic acidosis is a consequence of hypoxemia and is best corrected by restoring adequate tissue oxygenation. Cardiac output is reduced by interfering directly with myocardial contractility; by altering coronary artery perfusion pressure and by altering the distribution of oxygenated blood to the myocardium. For the past year, we have focused our attention to the elaboration and dissection of some of the cardiac mechanisms operating in shock. Investigations of the treatment of shock based upon physiological principles have proceeded in three phases: Hemorrhagic Shock; (2) Gram-negative bacterial endotoxinemic shock and Cardiogenic Shock. Models of each have been developed and standardized in the dog, and treatment methods have been studied with respect to circulatory hemodynamics, biochemical changes and survival value. Originator supplied keywords include: Shock; Cardiac output; Blood volume; Peripheral resistance.

Clinical Presentation & Diagnosis, Patient Encounters, and Patient Care and Monitoring Guidelines A standardized chapter format  
Laboratory values expressed in both conventional units and Systemé International (SI) units

This book, part of the European Society of Intensive Care Medicine textbook series, teaches readers how to use hemodynamic monitoring, an essential skill for today's intensivists. It offers a valuable guide for beginners, as well as for experienced intensivists who want to hone their skills, helping both groups detect an inadequacy of perfusion and make the right choices to achieve the main goal of hemodynamic monitoring in the critically ill, i.e., to correctly assess the cardiovascular system and its response to tissue oxygen demands. The book is divided into distinguished sections: from physiology to pathophysiology; clinical assessment and measurements; and clinical practice achievements including techniques, the basic goals in clinical practice as well as the more appropriate hemodynamic therapy to be applied in different conditions. All chapters use a learning-oriented style, with practical examples, key points and take home messages, helping readers quickly absorb the content and, at the same time, apply what they have learned in the clinical setting. The European Society of Intensive Care Medicine has developed the Lessons from the ICU series with the vision of providing focused and state-of-the-art overviews of central topics in Intensive Care and optimal resources for clinicians working in Intensive Care.
